Machine Learning Foundations

Inteligencia Artificial en los Sistemas de Control Autónomo
Máster en Ciencia y Tecnología desde el Espacio

Departamento de Automática

Objectives

1. Define Machine Learning (ML)
2. Delimite ML scope
3. Introduce the main ML tasks
4. Recognize problems as ML tasks

Bibliography

- Bishop, Christopher M. *Pattern Recognition and Machine Learning*. 2nd edition. Springer-Verlag. 2011
- Müller, Andreas C., Guido, Sarah. *Introduction to Machine Learning with Python*. O'Reilly. 2016

Table of Contents

Introduction

Justification

New opportunities

- Huge amount of new data sources: banking, social media, IoT, DNA, ...
- Increased computational power

New needs

- Manual data analysis is unfeasible
- Need of automatic methods

New goal

- Transform data into knowledge

Introduction

Definition (I)

> **ML definition**
>
> ML is the science (and art) of programming computers so they can *learn from data*.
>
> A. Géron, 2017

Alternative definitions

- Machine Learning is the field of study that gives computers the ability to learn without being explicitly programmed. Arthur Samuel, 1959.

- A computer program is said to learn from experience E with respect to some task T and some performance measure P, if its performance on T, as measured by P, improves with experience. E. Tom Mitchell, 1997.

Introduction
The alphabet soup of data analysis

(Source)
Many related terms

- Artificial Intelligence
- Machine Learning
- Deep Learning
- Big Data

And new careers

- Data Science
- Data scientist
- Data engineer
- ML engineer

Universidad de Alcalá

Introduction

Definition (II)

Traditional approach

Study problem → Write rules → Evaluate → Launch!

Analyze errors (between Evaluate and Study problem)

ML approach

Data

Study problem → Train → Evaluate → Launch!

Analyze errors
The data analysis process
The big picture

Transformation

Focus — Pre-processing — Data mining — Interpretation / Evaluation

Data — Target data — Preprocessed data — Transformed data — Patterns — Knowledge

(Source)
Steps in any ML application:

1. Data adquisition
2. Selection, cleaning and transformation (preprocessing)
3. Machine Learning
4. Learning evaluation
5. Explotation

> The goal in ML is to get a representation of those patterns

The data analysis process
Data adquisition (I)

Goal: Adquire data to perform ML
- From extremely easy -CSV file- to extremely complex -full Big Data system-

Public data repositories
- (Kaggle), (NASA Open Data Portal) , (Omniweb), (UCI Machine Learning Repository)

Customized adquisition and integration
- Integration from several data sources usually needed

customer

Cust-ID	name	address	age	income	credit-info	...

Universidad de Alcalá
The data analysis process
Data adquisition (II): CSV

CSV (*Comma-Separated Values*)

- Text format for tabular data
- Editable with system tools and Excel
- Rows store records
- Columns store attributes
- Fields are separated by commas

Year	Make	Model	Description	Price
1997	Ford	E350	ac, abs, moon	3000.00
1999	Chevy	Venture "Extended Edition"		4900.00
1999	Chevy	Venture "Extended Edition, Very Large"		5000.00
1996	Jeep	Grand Cherokee	MUST SELL! air, moon roof, loaded	4799.00

filename.csv

```
Year , Make , Model , Description , Price
1997 , Ford , E350 ,"ac ,   abs ,   moon" ,3000.00
1999 , Chevy ,"Venture  ""Extended  Edition""" ,"" ,4900.00
1999 , Chevy ,"Venture  ""Extended  Edition ,  Very  Large""" ,"" ,5000.00
1996 , Jeep , Grand  Cherokee ,"MUST  SELL !
air ,  moon  roof ,  loaded" ,4799.00
```

The data analysis process

Data adquisition (III): JSON

JSON: Data format for
hierarchical data

- Created in 2001 for
  stateless
  client-server
  communication

- Text-based

- Complex data
  structures

filename.json

```
{
  "firstName": "John",
  "isAlive": true,
  "age": 27,
  "address": {
    "streetAddress": "21 2nd Street",
    "city": "New York",
    "state": "NY",
  },
  "phoneNumbers": [
    {
      "type": "home",
      "number": "212 555-1234"
    },
    {
      "type": "office",
      "number": "646 555-4567"
    }
  ]
}
```

Types of Machine Learning systems
○○○○○○○○○○○○○○○○○○○○○○○○○○○

Main challenges of Machine Learning
○○○

Case studies
○○○○○○○

The data analysis process

Data adquisition (V): Space data sources

Data sources highly dependent on domain and mission

- Many missions have their own website to download data
- Each mission contains data from different instruments

There are, however, some integrated data products sources

- (OMNIWeb) - Heliophysics / Space Weather
- (CDAWeb) - Non-solar heliophysics
- (SSCWeb) - Satellite situation
- (HAPI) - "Integration of integrated" data sources
- Python packages
  - SunPy, AstroPy, SpacePy, PySat, PySPEDAS, etc

The data analysis process
Selection, cleaning and transformation (I)

Goal: Prepare data for ML

- This phase is usually named preprocess

ML requires a clean data table

- Rows are named instances
- Columns are named features or attributes
- We refer the number of features as dimensionality

In some ML problems we use graphs instead of tables

f_1	f_2	$\cdots$	f_n
$a_{1,1}$	$a_{2,1}$	$\cdots$	$a_{n,1}$
$a_{1,2}$	$a_{2,2}$	$\cdots$	$a_{n,2}$
$a_{1,3}$	$a_{2,3}$	$\cdots$	$a_{n,3}$
$a_{1,4}$	$a_{2,4}$	$\cdots$	$a_{n,4}$
$a_{1,5}$	$a_{2,5}$	$\cdots$	$a_{n,5}$

The data analysis process

Selection, cleaning and transformation (II)

Example: Bank data base

IDC	Years	Euros	Salary	Own house	Defaults
101	15	60000	2200	Yes	2
102	2	30000	3500	Yes	0
103	9	9000	1700	Yes	1
104	15	18000	1900	No	0
...	...	...	...	...	...

Example: Robot sensors

Timestamp	Sonar1	Sonar2	Sonar3	Sonar4
1	1.687	0.445	2.332	0.429
2	0.812	0.481	1.702	0.473
3	1.572	0.471	1.654	0.513
...	...	...	...	...

The data analysis process
Selection, cleaning and transformation (III)

Example: Image recognition

(Source)

Pixel1	Pixel2	Pixel3	$\cdots$	Pixel784
o	o	o	$\cdots$	o
$\cdots$	$\cdots$	$\cdots$	$\cdots$	$\cdots$
o	o	o	$\cdots$	o

The data analysis process
Selection, cleaning and transformation (IV)

Example: Text classification (bag-of-words representation)

1. Original text

   (1) John likes to watch movies. Mary likes movies too.
   (2) John also likes to watch football games.

2. Build list

   (1) "John","likes","to","watch","movies","Mary","likes","movies","too"
   (2) "John", also","likes","to","watch","football","games"

3. Build dictionary

   (1) {"John":1,"likes":2,"to":1,"watch":1,"movies":2,"Mary":1,"too":1};
   (2) {"John":1,"also":1,"likes":1,"to":1,"watch":1,"football":1,"games":1};

John	likes	to	watch	movies	Mary	too	also	games	⋯
1	2	1	1	2	1	1	0	0	⋯
1	1	1	1	0	0	0	1	1	⋯

The data analysis process
Selection, cleaning and transformation (V)

Preprocessing tasks

- Handle outliers (remove or leave them)
- Sample data (in case there are too much)
- Handle missing values
- Remove irrelevant or redundant features (feature selection)
  - For instance, attributes "social class" and "salary" contain highly correlated information
- Compute new attributes (feature engineering)
  - For instance, compute "population density" from "area" and "population"
- Transform attributes
  - Discretization, normalization, numerization, ...

The data analysis process
Data processing levels

Three levels of processing for data products in space applications

- Level 0: Unprocessed data from payload
- Level 1: Processed data
- Level 2: Processed data with geophysical variables

(More info)

The data analysis process
Machine Learning

Goal: Train an algorithm to perform a task

- As result, we obtain a model (or classifier or predictor depending on the context)

Machine Learning training methods (or ML tasks)

- Supervised learning: **classification** and **regression**
- Unsupervised learning: **clustering**, association, **dimensionality reduction** and anomaly detection
- Reinforcement learning
- Many others

No Free-Lunch Theorem

No learning algorithm is a priori guaranteed to work better
More info: (D. Wolpert, 1996)

Introduction
○○○○

The data analysis process
○○○○○○○○○○○○○●○○○

Types of Machine Learning systems
○○○○○○○○○○○○○○○○○○○○○○○○○

Main challenges of Machine Learning
○○○

Case studies
○○○○○○○

The data analysis process
Learning evaluation (I)

We do need to evaluate the trained model

- Models should perform well on new data

A naïve and wrong approach. Why is it wrong?

1. Train the model
2. Use the model to predict labels
3. Compute accuracy comparing predicted labels with known labels

Solution: Training and validation datasets

- **Training set**: Data used to train the models. Usually 70 %
- **Validation set**: Data used to validate the models. Usually 30 %
- Problems: Bias and loose of relevant data (serious in small datasets)

The data analysis process
Learning evaluation (II)

Crossvalidation

1. Divide dataset in folds

2. Take one fold for validation

3. Train with the other folds

4. Validate and compute performance

5. Take another fold and repeat until finish

6. Average performance measures
(Source)

Usually we use 10 folds

- 10-fold cross validation (or 10-CV)

The data analysis process
Learning evaluation (III)

Select a measure to evaluate learning

- Proper measures depends on the problem

Classification learning measures

- Accuracy: Ratio of correct predictions
- F-Measure
- Confusion matrix
- ROC curve

Regression learning measures

- Mean Absolute Error (MAE)
- Mean Squared Error (MSE)
- R^2

Validation error must be taken, always, on the validation set

Confusion matrix

		Predicted class		
		Class A	Class B	Class C
Actual class	Class A	100	0	10
	Class B	10	80	10
	Class C	30	0	70

Introduction
The data analysis process
Types of Machine Learning systems
Main challenges of Machine Learning
Case studies

The data analysis process
Model exploitation

Model explotation depends on the objectives

- In Data Science, the model is interpreted and a report wroten
  - Formal report, bussiness intelligence dashboard, ...
- In Machine Learning, the model is integrated into a software system
  - Web application, app, robot controller, ...

The model may need maintenance

Types of Machine Learning systems
Overview

We can classify ML systems based on several (non-exclusive) criteria

- Whether or not they are trained with human supervision
  - Supervised, unsupervised, semisupervised and Reinforcement Learning
- Whether or not they can learn incrementally
  - Online vs. batch learning
- When forecasting is done
  - Nowcasting vr. forecasting
- Type of analytics
  - Descriptive, predictive or prescriptive
- The goal of the system
  - Discriminative models vs. generative models

We focus on supervised and unsupervised model-based discriminative batch algorithms.

Types of Machine Learning systems
Supervised learning (I)

In supervised learning input data comes along with the desired output

- Usually human beings label the output (named labels)

f_1	f_2	$\cdots$	f_n	γ
$a_{1,1}$	$a_{2,1}$	$\cdots$	$a_{n,1}$	γ_1
$a_{1,2}$	$a_{2,2}$	$\cdots$	$a_{n,2}$	γ_2
$a_{1,3}$	$a_{2,3}$	$\cdots$	$a_{n,3}$	γ_3
$a_{1,4}$	$a_{2,4}$	$\cdots$	$a_{n,4}$	γ_4
$a_{1,5}$	$a_{2,5}$	$\cdots$	$a_{n,5}$	γ_5

Two main tasks in supervised learning

- **Classification** if γ is a categorical attribute. Target attribute named class
- **Regression** if γ is numerical

Advanced supervised learning tasks

- Semi-supervised learning, weakly supervised learning and multilabel classification

Types of Machine Learning systems ○○○○○○○○○○○○●○○○○○○○○○○○○○○○
Main challenges of Machine Learning ○○○
Case studies ○○○○○○○

Types of Machine Learning systems

Supervised learning: Regression (I)

Example: Does money make people happier? (example from (Géron, 2017))

Country	GDP	*LS*
Hungary	12,240	4.9
Korea	27,195	5.8
France	37,675	6.5
Australia	50,962	7.3
USA	55,805	7.2

LS = Life satisfaction

Linear regression

$\theta_0 = 4.85$
$\theta_1 = 4.91 \times 10^{-5}$

$$\text{life\_satisfaction} = \theta_0 + \theta_1 \times \text{GDP\_per\_capita}$$

Types of Machine Learning systems

Unsupervised learning

In unsupervised learning there are no labels

f_1	f_2	f_3	$\cdots$	f_n
$a_{1,1}$	$a_{2,1}$	$a_{3,1}$	$\cdots$	$a_{n,1}$
$a_{1,2}$	$a_{2,2}$	$a_{3,2}$	$\cdots$	$a_{n,2}$
$a_{1,3}$	$a_{2,3}$	$a_{3,3}$	$\cdots$	$a_{n,3}$
$a_{1,4}$	$a_{2,4}$	$a_{3,4}$	$\cdots$	$a_{n,4}$
$a_{1,5}$	$a_{2,5}$	$a_{3,5}$	$\cdots$	$a_{n,5}$

Tasks in unsupervised learning

- Clustering
- Association rules
- Dimensionality reduction
- Anomality detection

Types of Machine Learning systems

Unsupervised learning: Clustering (I)

Clustering is a set of techniques that identify groups of data (clusters)

- Algorithms: K-means, db-scan, Gaussian Mixture Models (GMM), Expectation Maximization (EM), ...

(Source)

Universidad
de Alcalá
Types of Machine Learning systems
Unsupervised learning: Clustering (II)

Example: Cluster word-sentence length in a books corpus

Clusters interpretation

- Long words and sentences: Philosophy?
- Short words and sentences: Novel?

Universidad
de Alcalá

Types of Machine Learning systems

Unsupervised learning: Clustering (III)

Example: Human resources department wants to know their employees profiles

Salary	Married	Car	Child.	Rent/owner	Syndicated	Leaves	Sen.	Sex
1000	Yes	No	0	Rent	No	7	15	M
2000	No	Yes	1	Rent	Yes	3	3	F
1500	Yes	Yes	2	Owner	Yes	5	10	M
3000	Yes	Yes	1	Rent	No	15	7	F
1000	Yes	Yes	0	Owner	Yes	1	6	M

Types of Machine Learning systems

Unsupervised learning: Clustering (IV)

	Group 1	Group 2	Group 3
Salary	1535	1428	1233
Married	77 %	98 %	0 %
Car	82 %	1 %	5 %
Child.	0.05	0.3	2.3
Rent/owner	99 %	75 %	17 %
Syndicated	80 %	0 %	67 %
Leaves	8.3	2.3	5.1
Seniority	8.7	8	8.1
Sex (M/F)	61 %	25 %	83 %

Analysis:

- Group 1: No children, with rented house. Low syndication. Many sick leaves.
- Group 2: No children, with car. High syndication. Low sick leaves. Usually women and rent.
- Group 3: With children, married, with car. Usually owners men. Low syndication.

```

where (confidence, support)

Types of Machine Learning systems

Unsupervised learning: Dimensionality reduction (I)

Dimensionality reduction transforms data into more convenient representations

- Reduce data dimensionality
- Visualize multidimensional data

Main algorithms

- Isomap
- Principal Components Analysis (PCA)
- T-distributed Stochastic Neighbor Embedding (t-SNE)

Types of Machine Learning systems

Unsupervised learning: Dimensionality reduction (II)

Example: Isomap

Types of Machine Learning systems

Unsupervised learning: Dimensionality reduction (IV)

Example: Hand-written digits recognition

- Images of hand-written digits
- 8x8 images (64 dimensions)
- 10 digits
- Classification problem

Universidad de Alcalá
Main challenges of Machine Learning
Under and overfitting

Underfitting: Does not learn

- Topology too simple
- The model does not fit data
- Solution:
  - Increase model complexity
(Source)

Overfitting: Memorizes samples

- Topology too complex
- Very serious concern in ML
- The model does not generalize data
- Model fails when exposed to new data
- Solutions:
  - Reduce model complexity
  - Increase dataset
  - Apply regularization

Main challenges of Machine Learning
The curse of dimensionality

ML algorithms are statistical by nature
- Count frecuency of observations in regions

Fewer observations per region as dimensionality increases
- Data become sparser
- Need of more data to keep patterns
- Increased overfitting risk

Goal: Reduce dimensionality as much as possible

(Source)

Universidad
de Alcalá
Main challenges of Machine Learning

Other challenges

- Insufficient data
  - Given enough data, algorithms tend to similar performance
  - Remember: ML is data-centric
- Non representative training data
- Poor quality data
- Irrelevant features
- Unbalanced datasets

(Source)

Case study 1: Bank propensity model

Client

- Bank

Business problem

- Identify those clients prone to buy a service

Data

- Available on several databases
- Historical data on service adquisition available

Propose a solution to:

- Data adquisition
- ML task
- Predictive or explicative model
- Model explotation
- Model maintenance

Case studies

Case study 2: Social media compaign impact

Client

- Car manufacturer

Business problem

- Real-time analysis of a campaign impact in Twitter
- Answer if people have a positive reaction to the campaign

Data

- None

Propose a solution to:

- Data adquisition
- ML task
- Predictive or explicative model
- Model explotation
- Model maintenance

Case studies

Case study 3: Hubble FGS-3 servo failure prediction

Client

- NASA

Business problem

- Predict Hubble FGS-3 servo failure

Data

- Compensated error telemetry
- Servo will fail if compensated error exceeds a threshold

Propose a solution to:

- ML task
- Predictive or explicative model
- Model explotation
- Model maintenance

FGS-3 A-Servo, Mean value of Error > 234.000000 error measurements per interval

(Source of this study case)

Case studies

Case study 4: Fall detection with triaxial accelerometer

Client

- Technological start-up

Business problem

- Detect falls with a smartwatch
- Improve elderly people attention

Data

- None

Propose a solution to:

- Data adquisition
- ML task
- Data preprocessing
- Model explotation
- Model maintenance

(More info)

Case studies

Case study 5: Fall detection with sound

Client

- Technological start-up

Business problem
- Detect falls with sound
- Improve elderly people attention

Data

- None

Propose a solution to:

- Data adquisition
- ML task
- Data preprocessing
- Model explotation
- Model maintenance

Energy Mean	Energy Std
Number of Zeros Mean	Number of Zeros Std
Spectral Flux Mean	Spectral Flux Std
Roll off Factor Mean	Roll off Factor Std
Spectral centroid Mean	Spectral Centroid Std

(More info)

Universidad de Alcalá

Case studies

Case study 6: NASA JPL BioSleeve

Client

- NASA JPL Advanced Robotics Group

Business problem

- Recognize hand gestures (more info)

Data

- None

Propose a solution to:

- Data adquisition
- ML task

(Source)

Case study 7: UAV terrain classification

Client

- NASA JPL Advanced Robotics Group

Business problem

- Recognize terrain type for automatic UAV landing
- (Video)

Data

- UAV down-looking camera
- No dataset available

Propose a solution to:

- Data adquisition
- ML task
- Feature extraction
